

Restaurant Reservation & Waitlist Manager

Project Case Study: Workflow Automation

Overview

This automation manages restaurant table reservations and the customer waitlist. Every minute, the workflow checks the reservation database for customers whose table is ready. When a table becomes available, the system automatically sends a notification email, updates the reservation status to NOTIFIED, and logs the event into the database for reporting.

Business Problem & Solution

Business Problem: Restaurants lose valuable time answering phone calls and manually managing waiting customers during busy hours.

Solution: An automated workflow that continuously monitors reservations, instantly notifies waiting customers when a table becomes available, updates the reservation status, and stores every notification for reporting.

Workflow Architecture

Tech Stack & Key Features

Tech Stack: n8n, PostgreSQL, SMTP Email, SQL, Business Automation

Features:

- Automatic reservation checking
- Efficient waitlist management
- Automatic customer email notification
- Dynamic reservation status updates
- Detailed notification logging
- Seamless database integration
